1. Introduction

The A822.lib is a collection of data acquisition subroutines for A-822PGH/PGL. These subroutines are written with C language and perform a variety of data acquisition operations. These subroutines can be classified as follow:

- Digital I/O
- D/A conversion
- A/D conversion via Polling
- A/D conversion via Interrupt
- A/D conversion via DMA
- Initialization
- Pacer Trigger control
- Machine independent timer

The subroutines in A822.lib are easy understanding as its name standing for. It provides powerful, easy-to-use subroutine for developing your data acquisition application. To speed-up your developing process, some demonstration C source program are provided.

This driver can support 8 cards maximum in one PC based system. But only can support 2 interrupt/DMA boards at most and the other board will be running in polling mode. So the validate configuration of using 8 boards may be as follows:

- **8 polling**
- **7 polling + 1 DMA**
- **7 polling + 1 interrupt**
- **6 polling + 2 DMA**
- **6 polling + 2 interrupt**
- **6 polling + 1 DMA + 1 interrupt**
- **Support 8 cards in one system maximum**
- **Only 2 cards can use DMA/interrupt at most**

2. Installation

It is recommended to install the A-822PHL/PGH application software to your hard disk to get the best performance. Before beginning, to make a backup copy of the A-822PGH/PGL application software. Store the original diskette in a safe place. The A-822PGL/PGH application disk includes the following files:

- A822\A822DIAG.EXE : The diagnostic utility for 822PGL/PGH.
- A822\A822.CFG : The configuration file of A822DIAG.EXE.

- A822\lib\A822.h : The header file for MSC/TC.
- A822\lib\SA822.lib : The small model library for MSC/TC.
- A822\lib\MA822.lib : The medium model library for MSC/TC.
- A822\lib\CA822.lib : The compact model library for MSC/TC.
- A822\lib\LA822.lib : The large model library for MSC/TC.
- A822\lib\HA822.lib : The huge model library for MSC/TC.

- A822\demo\msc*.* : The demo program for MSC 5.X
- A822\demo\tc*.* : The demo program for TC 2.X
- A822\demo\bc*.* : The demo program for BC 3.X

- A822\demo\msc*.c : The source files of demo program
- A822\demo\msc*.exe : The execution files of demo program
- A822\demo\msc*.bat : The compiler&link batch files of demo program

- A822\demo\tc*.c : The source files of demo program
- A822\demo\tc*.exe : The execution files of demo program.
- A822\demo\tc*.prj : The compiler&link project files of demo program

- A822\demo\bc*.c : The source files of demo program
- A822\demo\bc*.exe : The execution files of demo program
- A822\demo\bc*.prj : The compiler&link project files of demo program

- A822\demo\tc\testpoll.c : The demo program for A/D Polling testing
 - A822\demo\tc\testint.c : The demo program for A/D Interrupt testing
 - A822\demo\tc\testdma.c : The demo program for A/D DMA testing
 - A822\demo\tc\testdio.c : The demo program for digital I/O testing
 - A822\demo\tc\testda.c : The demo program for D/A testing
 - A822\demo\tc\testad.c : The demo program for A/D Polling/INT/DMA testing
 - A822\demo\tc\gain1.c : Delay the gain settling time for A822PGH
 - A822\demo\tc\gain2.c : Delay the gain settling time for A822PGL
 - A822\demo\tc\polling.c : Performance of A/D polling mode
 - A822\demo\tc\interrup.c : Performance of A/D interrupt mode
 - A822\demo\tc\dma.c : Performance of A/D DMA mode
 - A822\demo\tc\pollwave.c : Show wave form by polling mode
 - A822\demo\tc\intwave.c : Show wave form by interrupt mode
 - A822\demo\tc\dmawave.c : Show wave form by DMA mode
-
- **A822\demo\msc*.c : only program1 ~ program6 are supported**
 - **A822\demo\bc*.c : only program1 ~ program6 are supported**

2.1 Compiler & link using MSC

- The including file is **A822.H**
- There are 5 different mode library files : **S/C/M/L/HA822.LIB**
- Support MSC 6.x compiler
- **SMALL** model compiler & link command : [CL /AS program.c SA822.LIB](#)
- **COMPACT** model compiler & link command : [CL /AC program.c CA822.LIB](#)
- **MEDIUM** model compiler & link command : [CL /AM program.c MA822.LIB](#)
- **LARGE** model compiler & link command : [CL /AL program.c LA822.LIB](#)
- **HUGE** model compiler & link command : [CL /AH program.c HA822.LIB](#)
- A:\A822\demo\msc*.bat give some examples for compiler&link batch file

2.2 Compiler & link using TC

- The including file is **A822.H**
- There are 5 different model library files : **S/C/M/L/HA822.LIB**
- Support TC 2.x compiler
- Use text editor to create a project file include : program.c ?A822.lib
- Use TC integrated environment to **select the correct compiler model**
- A:\A822\demo\tc*.prj give some examples for compiler&link project file

2.3 Compiler & link using BC

- The including file is **A822.H**
- There are 5 different model library files : **S/C/M/L/HA822.LIB**
- Support BC 3.x compiler
- Use BC integrated environment to create a project file include : program.c ?A822.lib
- Use BC integrated environment to **select the correct compiler model**
- A:\A822\demo\bc*.prj give some examples for compiler&link project file

3. C Language Library

- A822.H
- A822_Initialize
- A822_ActiveBoard
- A822_Check_Address
- A822_DI
- A822_DO
- A822_DA
- A822_AD_SetChGainMode
- A822_AD_PollingVar
- A822_AD_PollingArray
- A822_AD_INT_Start
- A822_AD_INT_Count
- A822_AD_INT_Stop
- A822_AD_DMA_Start
- A822_AD_DMA_Stop
- A822_AD_DMA_Status
- A822_Delay

3.1 A822.H

```

3.2 A822_Initialize

- **Description :**

A822_Initialize initialize the 822PGL/PGH board. This function should be called before using the other A822.lib subroutines. This function will detect automatically 822PGL/PGH board according to I/O base address. Auto detection failure will occur if I/O base address not match with hardware DIP switch. **This driver supports 8 cards max. But only 2 cards can perform A/D operation through DMA or Interrupt.** The others can perform A/D operation via polling. After this subroutine is executed, **the board which CardNo specified will be active.** If more than one board in a system, the A822_ActiveBoard(int BoardNo) must use to switch to the active board.

- **Syntax :**

```
int A822_Initialize(int CradNo, int BaseAddr, int DmaNo, int IrqNo);
```

- **Input Parameter :**

CardNo : The validate card number is from 0 to 7.

IOBase : I/O base address. (must match with hardware DIP switch)

DmaNo : DMA channel number. (1 or 3 must match with hardware jumper)

-1 = NO DMA

IrqNo : Interruption channel number. (must match with hardware jumper)

-1= NO Interrupt

- **Return Value :**

CheckBoardError : IO base address detection error

CardNumError : error in card number input (validate numbers are from 0 to 7)

CheckDmaError : error in DMA channel number (validate numbers are 1 or 3)

CheckIrqError : error in IRQ channel number

NoError

- **Demo program :** Sec. 4.1 ~ Sec. 4.14

● Example 1 :

```
#include "A822.h"
main()
{
int CradNo=0;          /* only one card */
int IOBase=0x220;      /* The IO base address for A822 */
int DmaNo=1;           /* The DMA channel no. */
int IrqNo=15;          /* The IRQ channel no. */

A822_Initialize(CradNo,IOBase,DmaNo,IrqNo); /* board_0 is active */
/* only one card in this system, so no need to call A822_ActiveBoard(0) */

.
.

}
```

● Example 2 :

```
#include "A822.h"
main()
{
A822_Initialize(0,0x200,1,12); /* now board_0 is active*/
A822_Initialize(1,0x210,3,15); /* now board_1 is active*/
A822_Initialize(2,0x220,-1,-1); /* now board_2 is active*/

/* now there are 3 cards in this system, so A822_ActiveBoard(?) need to be called */

A822_ActiveBoard(0); /* now card_0 is active */

A822_ActiveBoard(1); /* now card_1 is active */

A822_ActiveBoard(2); /* now card_2 is active */

}
```

3.3 A822_ActiveBoard

- **Description :**

This driver support 8 different cards in one system max. The A822_Initialize(...) will initialize the separate boards. But only one board can be active at one time. So the software should active the selected card before perform specific function. The A822_ActiveCrad(?) is used to active the desired card in the system. If only one card in the system, there is no need to use this subroutine.

- **Syntax :**

```
int A822_ActiveBoard(int BoardNo);
```

- **Input Parameter :**

BoardNo : The validate board number is from 0 to 7. This number is equal to CardNo in
A822_Initial(CardNo,.....);

- **Return Value :**

CardNumError : error in card number input (validate numbers are from 0 to 7)
NoError

- **Example 1 :**

See sec. 4.6

3.4 A822_Check_Address

- **Description :**

This subroutine check if the I/O base address is match with the board. This subroutine send a software trigger signal to the A/D converter and check the ready bit of A/D conversion. If the **ready bit can not be clear to zero in a fixed time, this subroutine will return CheckBoardError.**

- **Syntax :**

```
int A822_Check_Address(int BaseAddr);
```

- **Input Parameter :**

BaseAddr : base address of the board

- **Return Value :**

CheckBoardError : The BaseAddr does not match with the hardware setting

NoError

- **Demo program :** Sec. 4.1 ~ Sec. 4.14

- **Example 1 :**

```
#include "A822.h"  
main()  
{  
if (A822_Check_Address(0x220)==NoError)  
{  
    printf("\n0x220 find a card");  
}  
else  
{  
    printf("\n0x220 cannot find any card");  
}  
}
```

3.5 A822_DI

- **Description :**

This function read the digital input data from I/O port Base+6 and Base+7.

- **Syntax :**

```
unsigned int A822_DI( void );
```

- **Input Parameter :**

None.

- **Return Value :**

A 16 bit data from digit input port.

- **Demo program :** Sec. 4.4

- **Example 1 :**

```
#include "A822.H"  
main()  
{  
    unsigned DigitInput;  
  
    A822_Initialize(0,0x220,1,15);  
    . . .
```

```
    DigitInput=A822_DI();  
    . . .
```

```
}
```

3.6 A822_DO

● Description :

This function write data to I/O port Base+0x0D and Base+0X0E.

● Syntax :

```
void A822_DO(unsigned DigitalOutput);
```

● Input Parameter :

DigitalOutput: data send to output port, 0 through 65535.

● Return Value :

None.

● Demo program : Sec. 4.4

● Example 1 :

```
#include "A822.H"
main()
{
unsigned DigitOutput=0x1234;
```

A822_DO(DigitOutput);

}

3.7 A822_DA

- **Description :**

This function is used to writes 12 bits data to D/A output latch register.

- **Syntax :**

```
int A822_DA(int Channel, unsigned int data);
```

- **Input Parameter :**

Channel : D/A channel number, 0 = channel 0, 1 = channel 1.

data : 0 through 4095.

- **Return Value :**

DAchannelError : validate Channel is only 0/1

NoError

- **Demo program :** Sec. 4.5

- **Example 1 :**

```
#include "A822.h"
main()
{
    unsigned DAOutput=0x1234;

    A822_Initialize(0,0x220,15,1);

    A822_DA(0,DAOutput); /* D/A channel 0 */
    A822_DA(1,DAOutput); /* D/A channel 1 */

}
```

3.8 A822_AD_SetChGainMode

- **Description :**

This function is used to set the A/D channel number, gain and operation mode. The detail information is given in “A822 Hardware Manual” section 2.7.

- **Syntax :**

```
void A822_AD_SetChGainMode(int Channel, int Gain, int Mode)
```

- **Input Parameter :**

Channel : A/D channel number, 0 ~ 15 for single-ended, 0 ~ 7 for differential

Gain : A/D gain control code, 0 ~ 11 for A822PGH, 0 ~ 8 for A822PGL

Mode : A/D operation mode, 0 through 7

- **Return Value :**

None

- **Demo program :** Sec. 4.1 ~ sec. 4.14

- **Example 1 :**

```
#include "A822.h"
main()
{
int Gain,Mode;

A822_Initialize(0,0x220,1,15);

/* user must define Gain, Mode here */

for (channel=0; channel<16; channel++)
{
    A822_AD_SetChGainMode(channel,Gain,Mode);
    /* delay settling time if needed */
}

}
```

3.9 A822_AD_PollingVar

- **Description :**

This function performs the A/D conversion by polling .

- **Syntax :**

unsigned A822_AD_PollingVar(void)

- **Input Parameter :**

None.

- **Return Value :**

The result of A/D conversion..

If there is a timeout occurred, the data will be set to 0xffff.

- **Demo program :** Sec. 4.1/4.7/4.8/4.9/4.12

- **Example 1 :**

```
#include "A822.h"
#include "stdio.h"
main()
{
int channel,gain,mode;
unsigned PollData;
float volt;
A822_Initialize(0,0x220,1,15);
channel=0; /* channel 0 */
gain=0; /* bipolar, gain=1, range=-5V ~ +5V */
mode=1; /* polling mode */
A822_AD_SetChGainMode(channel,gain,mode);

.

PollData=A822_AD_PollingVar();
volt=((float)PollData-2048.0)/2048.0*5.0;
printf("\ndata = %xH = %5.3fV\n",PollData,volt);

.
}
```

3.10 A822_AD_PollingArray

- **Description :**

This function performs the A/D conversion by polling method.

- **Syntax :**

```
void A822_AD_PollingArray(unsigned *Buffer, unsigned Count)
```

- **Input Parameter :**

Buffer : address of buffer.

Count : number of A/D conversions .

- **Return Value :**

None.

If there is a timeout occurred, the data will be set to 0xffff.

- **Demo program :** Sec. 4.1/4.7/4.8/4.9/4.12

- **Example 1 :**

```
#include "A822.h"
#include "stdio.h"

main()
{
    int channel,gain,mode;
    unsigned int i,Buffer[1000],DesireCount=1000;
    A822_Initialize(0,0x220,1,15);
    channel=0; /* channel 0 */
    gain=0;      /* bipolar, gain=1, range=-5V ~ +5V */
    mode=1;      /* polling mode */
    A822_AD_SetChGainMode(channel,gain,mode);

    A822_AD_PollingArray(Buffer, DesireCount);

    for (i=0; i<10; i++) printf("\nBuffer[%d]=%x",i,Buffer[i]);
}
```

3.11 A822_AD_INT_Start

- **Description :**

Transfer A/D conversion data by interrupt. The sampling rate of pacer trigger is $2M/(c1*c2)$ Hz. The detail information is given in “A822 Hardware Manual” section 2.7.

- **Syntax :**

```
int A822_AD_INT_Start(int *Buffer, unsigned int Count , int c1 , int c2)
```

- **Input Parameter :**

Buffer : address of Buffer store A/D conversion data.

Count: number of A/D conversion to perform.

c1 : 16 bits divisor in Timer/Counter 1.

c2 : 16 bits divisor in Timer/Counter 2.

- **Return Value :**

CheckIrqError : IRQ channel number error

NoError : no error

- **Example 1 :**

See sec.4.2/4.10/4.13

- **NOTE : The C1 & C2 has some constraints :**

1. 1 is invalidate
2. 3 is invalidate
3. $2000/(C1*C2)$ can not over 110

If C1=4 and C2=5, pacer timer= $2000/(4*5)=100K \rightarrow$ validate

if C1=2 and C2=6, pacer timer= $2000/111.1K > 110K \rightarrow$ invalidate

The test program in sec. 4.10 & 4.13 can test the A/D performance by interrupt mode. In general, the user can get the A/D performance about 60K in the normal PC AT/486 system.

But this performance is machine dependent, so the user must test to get this maximum performance.

3.12 A822_AD_INT_Count

- **Description :**

Return the current A/D conversion count number.

- **Syntax :**

unsigned A822_AD_INT_Count(void)

- **Input Parameter :**

None.

- **Return Value :**

Current count value.

- **Example 1 :**

See sec.4.2/4.10/4.13

3.13 A822_AD_INT_Stop

- **Description :**

Stop the operation initiate by A822_AD_INT_Start() function.

- **Syntax :**

```
void A822_AD_INT_Stop(void)
```

- **Input Parameter :**

None.

- **Return Value :**

None.

- **Example 1 :**

See sec.4.2/4.10/4.13

3.14 A822_AD_DMA_Start

- **Description :**

Transfer A/D conversion data by DMA. The sampling rate of pacer trigger is $2M/(c1*c2)$ Hz. The detail information is given in “A822 Hardware Manual” section 2.7.

- **Prototype :**

```
int A822_AD_DMA_Start(int far *Buffer, unsigned count , int c1 , int c2)
```

- **Input Parameter :**

Buffer : address of buffer store A/D conversion data.

Count : number of A/D conversion to perform.

c1 : 16 bits divisor in Timer/Counter 1.

c2 : 16 bits divisor in Timer/Counter 2.

- **Return Value :**

CheckDmaError : DMA channel specified in A_822_Initial(...) is error

NoError

- **Example 1 :**

See sec.4.3/4.11/4.14

- **NOTE :** The C1 & C2 has some constraints :

1. 1 is invalidate
2. 3 is invalidate
3. $2000/(C1*C2)$ can not over 110

If C1=4 and C2=5, pacer timer= $2000/(4*5)=100K \rightarrow$ validate

if C1=2 and C2=6, pacer timer= $111.1K > 110K \rightarrow$ invalidate

The test program in sec. 4.11 & 4.14 can test the A/D performance by DMA mode. In general, the user can get the A/D performance about 100K in the normal PC AT/486 system. **But this performance is machine dependent**, so the user must test to get this maximum performance.

3.15 A822_AD_DMA_Status

- **Description :**

Return the status of DMA operation.

- **Syntax :**

```
int A822_AD_DMA_Status( void )
```

- **Input Parameter :**

None.

- **Return Value :**

0 : A/D DMA operation is finished

1 : A/D DMA operation is not finished

- **Example 1 :**

See sec.4.3/4.11/4.14

3.16 A822_AD_DMA_Stop

- **Description :**

Stop the operation initiate by A822_AD_DMA_Start() function.

- **Syntax :**

```
void A822_AD_DMA_Stop( void )
```

- **Input Parameter :**

None.

- **Return Value :**

None.

- **Example 1 :**

See sec.4.3/4.11/4.14

3.17 A822_Delay

- **Description :**

Use counter 0 to implement a machine independent timer. The detail information is given in “A822 Hardware Manual” section 2.6.

- **Syntax :**

```
int A822_Delay(unsigned int DownCount)
```

- **Input Parameter :**

DownCount : from 1 to 0x7fff, 1 count=0.5 us

- **Return Value :**

DelayError : counter_0 hardware function error

NoError

- **Example 1 :**

See sec.4.7/4.8

- **NOTE :**

1. The software driver assume the JP6 select the internal 2M stable clock. If the JP6 setting error, the A822_Delay() will not function properly.
2. Because the counter0 is used by A822_Delay(), the counter0 can not be use as a user timer/counter.

4. Demo Program

- A822\demo\tc\testpoll.c : The demo program for A/D Polling testing
- A822\demo\tc\testint.c : The demo program for A/D Interrupt testing
- A822\demo\tc\testdma.c : The demo program for A/D DMA testing
- A822\demo\tc\testdio.c : The demo program for digital I/O testing
- A822\demo\tc\testda.c : The demo program for D/A testing
- A822\demo\tc\testad.c : The demo program for A/D Polling/INT/DMA testing
- A822\demo\tc\gain1.c : Delay the gain settling time for A822PGH
- A822\demo\tc\gain2.c : Delay the gain settling time for A822PGL
- A822\demo\tc\polling.c : Performance of A/D polling mode
- A822\demo\tc\interrup.c : Performance of A/D interrupt mode
- A822\demo\tc\dma.c : Performance of A/D DMA mode
- A822\demo\tc\pollwave.c : Show wave form by polling mode
- A822\demo\tc\intwave.c : Show wave form by interrupt mode
- A822\demo\tc\dmawave.c : Show wave form by DMA mode

4.1 TESTPOLL.C

- I/O ADDRESS=0x220, NO Interrupt, NO DMA
- Support 8 boards at most

```
#include<stdio.h>
#include<conio.h>
#include"A822.h"

int Base=0x220;
int Buf[1000];

void main(void)
{ int err;
  int i;
  float rate=5.0/2048.0;

  err=A822_Initialize(0,Base,-1,-1);
  if(err){
    if(err==CheckBoardError){
      printf("Address 0 Error!\n");
    }
    else if(err==CardNumError){

4.7 GAIN1.C

- I/O ADDRESS=0x220, NO Interrupt, NO DMA
- Support 8 boards at most
- Press any key to stop this program
- This program is designed for A822_PGH.
- The gain settling time is described in Hardware manual sec. 2.4.6 & sec. 2.4.7.
- Validate for single-end or differential signal (must set correct hardware jumper and correct wire connection, that is to say, the software is same but the hardware jumper and wire connection are different)
- This program only take care the gain settling time. If the multiplexer settling time is needed, this software must to delay another settling time. (refer to Hardware manual sec. 2.4.7)
- If the multiplexer and gain control code are changed nearly at the same time, the settling time is the longer one instead of summation of both settling time.

```
#include  <stdio.h>          *****/
#include  "A822.h"           /* */
                           /* for A822PGH */

4.9 POLLING.C

- I/O ADDRESS=0x220, NO Interrupt, NO DMA
- This program is designed to evaluate the performance of A/D operation by polling mode.
- This program will perform 10*100K times A/D conversion by polling mode. If the performance is 100K, this operation will take about 10 sec.
- This program will compute the performance automatically.
- performance = (10/operation time)*100K
- If operation time = 10 sec → performance =100K
- If operation time = 20 sec → performance = 50K
- The polling mode performance will depend on the performance of CPU.
- If use ASC-TI486/33M CPU board of ICP, the performance is about 100K

```
#include<stdio.h>
#include<conio.h>
#include<sys\timeb.h>
#include"A822.h"

int Base=0x220;
int Buffer[1000];
struct timeb t1,t2;

main(void)
{
    int i,j,err;
    float volt,temp,t;
    unsigned int PollData;
```

```

err=A822_Initialize(0,Base,-1,-1);
if(err){
    if(err==CheckBoardError){
        printf("Address 0 Error!\n");
    }
    else if(err==CardNumError){
        printf("Card Number Error!(range:0-7)\n");
    }
    return;
}

for(i=0; i<1000; i++) Buffer[i]=1024;
A822_AD_SetChGainMode(0,A822_BI_1,POLLING_MODE);
printf("\nWait about 10 sec. to perform 10*100K polling");
ftime(&t1);

}
}

```

4.10 INTERRUP.C

- I/O ADDRESS=0x220, Interrupt=15, NO DMA
- Assume channel_0, Gain=1, interrupt mode
- Input C1 & C2 to set the sampling rate (pacer rate)
- Input the minimum & maximum value of input signal
- This program will loop test until user stop it.
- Press any key to stop this program
- This program is designed to evaluate the performance of A/D operation by interrupt mode.
- The interrupt mode performance will depend on the performance of CPU.
- If performance > 60K, the user must use test program intwave.exe(sec. 4.13) to verify again. Because the interrupt request register must be clear to allow next interrupt (Hardware manual sec. 2.4.5), the interrupt service routine maybe has no enough time to clear this register before next pacer clock generated. So this pacer clock may be skipped and this means the performance is mismatch with pacer timer.
- If use ASC-TI486/33M CPU board of ICP, the performance is about 60K

```
#include    <stdio.h>
#include    "A822.H"

int    Buffer[2000];
main(void)
{
    int  DesireCount=2000;    /* The count which We desire to transfer */
    int  NowCount;           /* The count which is transferring now */
    int  i,j,c1,c2;
    float volt,min,max,min2,max2,err,rep;

    for(i=0; i<DesireCount; i++) Buffer[i]=1024;
    A822_Initialize(0,0x220,-1,15);
    A822_AD_SetChGainMode(0,A822_BI_1,INTERRUPT_MODE);
```

```

/* The clock rate of pacer trigger is equal to 2M/(c1*c2). */
printf("\nC1 C2="); scanf("%d %d",&c1,&c2);
printf("\nMin Max="); scanf("%f %f",&min,&max); /* input range */
err=0; rep=0; min2=5.0; max2=-5.0;
for(;;)
{
